### EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Fraster Rowand on December 3, 2008.

2. Claims 1, 11 and 23 have been amended as follows:

1. (currently amended) In a communications system having a gateway containing a group of interface devices each configured with the same functionality for assembling messages transmitted as sequences of data packets from within a coverage area of a wireless communications network, a method for assembling a message from a sequence of data packets, including:

receiving at one interface device of the group of interface devices within a gateway, each configured with the same functionality, from the wireless communications network at least one data packet of a sequence of data packets that collectively form a message;

determining if the at least one data packet meets a predetermined criteria based on the location of the at least one data packet in the sequence of data packets, and if so claiming ownership of the sequence of data packets by sending out a request to the other" interface devices of the group for any data packets of the

Art Unit: 2419

sequence received by the other interface devices and receiving at the one interface device any data packets sent by the other interface devices in response to the request; and

assembling the data packets of the sequence into the message at the one interface device.

11. (currently amended) An interface device comprising:

one of a group of interface devices within a gateway, each configured with the same functionality, for receiving messages transmitted as sequences of data packets from within a coverage area of a wireless communications network, and assembling the received data packets into messages;

wherein the group of interface devices being coupled to a gateway network for communicating there between, ~~each of the interface devices in the group of interface devices configured with the same functionality~~, the interface device including a message assembler for determining if the interface device should assemble a message for a sequence of data packets of which the interface device has received at least one data packet, based on whether the interface device has received a data packet having a predetermined location in the sequence of data packets, and if so claiming ownership of the sequence of data packets by sending out a request for any missing data packets to the other interface devices in the group over the gateway network and assembling the message upon receiving the missing data packets<sub>1</sub>.

wherein the message assembler determines if the interface device should assemble the message based on whether the interface device has received a data packet having a predetermined location in the sequence of data packets.

23. (Currently Amended) A gateway for routing messages between a wireless packet data network and a client network, the wireless packet data network enabling a mobile device to transmit a message as a sequence of data packets, the gateway comprising:

a client network interface for communicating with the client network;

a group of wireless transport interface devices each connected to one or more wireless network adaptors for receiving data packets from the wireless network and each being configured with the same functionality to assemble the received data packets into messages; and

a gateway network connecting each of the wireless transport interface devices to the client network interface,

wherein each of the wireless transport interface devices includes a message assembler, the message assembler being configured to determine if a received data packet from a sequence of data packets is the last data packet in the sequence and, if so, claim ownership of the sequence by sending a request to the other wireless transport interface devices in response to which the other wireless transport interface devices reply with any data packets from the sequence that they have received, and wherein the message assembler claiming ownership of a sequence is configured to

Art Unit: 2419

assemble the message after receiving any data packets from the sequence from the other wireless transponder interface devices.
